The Notebook paths.nb

In this notebook we arrive at the result in Eq. (11), which is the generalized entanglement measure for the intermediate case of path superposition with non-negligible gaussian width. The calculation proceeds as follows: (1) defining the non-relativistic action, (2) finding the classical solutions of the system, (3) computing the gaussian integrals in Eq. (9), (4) calculating for this wavefunction the generalized entanglement measure [Swain et al, Phys. Rev. A 105, 052441 (2022)] defined in Eq. (28), to get Eq. (11).

Action

We define action of the gravitational interaction: SGhb = S_G / \hbar . This is the Newtonian potential, as we work in the non-relativistic limit in this calculation. The functions q1, q2 are the variables for the lagrangian and action.

Now that we have defined the action, we proceed to finding the solution to the classical equations of motion, which we will use for the stationary-phase approximation in Eq. (9).

Classical Solutions

We find the classical trajectories of the particles for initial locations y1p, y2p = y'_1/α , y'_2/α and final locations y1, y2 = y_1/α , y_2/α . Here, the y's are in units of α , the gaussian's width. We do it by solving the system under the second order approximation in ϵ . The problem becomes two harmonic oscillators with some frequency trp $\times \omega$, which are coupled by another spring, which is gravity. The variable trp is just a bookkeeping variable which will be taken to zero to achieve the trajectories of the two otherwise free particles coupled by gravity.

mySeries // Simplify

Out[⊕] =
{True, True}
```

Wavefunction

We would now like to compute the wavefunction $\psi^{-fi}(y1, y2)$ as given in Eq. (9). We start with achieving the expression for the on-shell (= stationary-phase approximated) action $S_a^- + S_G^-$, here Shb.

```
In [*]:= Lhb = LGhb + Lunc /. {q1 \rightarrow x1, q2 \rightarrow x2} // mySeries // Simplify; Shb1 = Integrate[Lhb , {ti, 0, t}]; Shb = Shb1 - (Shb1 /. {y1 \rightarrow 0, y2 \rightarrow 0, y1p \rightarrow 0, y2p \rightarrow 0}) // Expand // Refine // Simplify Out[*] = \frac{1}{6 \text{ t} \omega} \left(3 \text{ y2}^2 - 6 \text{ y2 y2p} + 3 \text{ y2p}^2 - 3 \text{ t}^2 \text{ y2} \in \phi \omega^2 - 3 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p}^2 \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ t}^2 \text{ y2p} \in \phi \omega^2 + 2 \text{ y2p} \in \phi \omega^2
```

We now solve the y1p and y2p integrals while also performing the approximations. We denote for any function f the parts fExp and fPre such that $f(x) = fPre(x) \times e^{fExp(x)}$.

The initial state is a sum of four gaussians with $\xi 1$, $\xi 2 = \pm \beta / \alpha$. We therefore perform one calculation (the variable summand) and then use it four times with the appropriate replacements of $\xi 1$, $\xi 2$.

calculate the norm squared normsq of the state, integrating each separate exponent separately using our myGauss function:

```
wfExp0 = {wfExp /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow \xi\}, wfExp /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow \xi\},
      wfExp /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow -\xi\}, wfExp /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow -\xi\}\};
wfExpC0 = {wfExpC /. \{\xi1 \rightarrow \xi, \xi2 \rightarrow \xi\}, wfExpC /. \{\xi1 \rightarrow -\xi, \xi2 \rightarrow \xi\},
      wfExpC /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow -\xi\}, wfExpC /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow -\xi\}\};
wfPre0 = {wfPre /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow \xi\}, wfPre /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow \xi\},
      wfPre /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow -\xi\}, wfPre /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow -\xi\}\};
wfPreC0 = {wfPreC /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow \xi\}, wfPreC /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow \xi\},
      wfPreC /. \{\xi 1 \rightarrow \xi, \xi 2 \rightarrow -\xi\}, wfPreC /. \{\xi 1 \rightarrow -\xi, \xi 2 \rightarrow -\xi\}\};
normsq = 0;
Do[
  preee = wfPreC0[i] x wfPre0[j] // mySeriesSq;
  preee = preee // Simplify;
  res = myGauss[preee, wfExpC0[i]] + wfExp0[j]], {y1, y2}];
  res = res // mySeriesSq;
  res = res // Simplify;
  If[i \neq j, res = 2 myRe[res];];
  normsq += res;
  , {i, 1, Length[wfExp0]}, {j, i, Length[wfExp0]}]
normsq = normsq // Simplify;
```

Generalized Entanglement Measure

we now calculate the entanglement measure in Eq. (28) after replacing the norm square in the formula by multiplication with the conjugate:

```
| [ \psi (y1, y2) \psi^* (y'1, y2) dy2 |
|^2 = [\psi^* (y1, y2) \psi (y'1, y2) \psi (y1, y'2) \psi^* (y'1, y'2) dy2 dy'2
```

each ψ contains 4 elements, so we have 16 elements in the integrand. We calculate only once (variable summand2), and then sum over the 16 possible choices of the signs in the ξ 's.

```
(*each of the four multipicants inside the integral above is
           slightly different in where is the ' and whether it is conjugate*)
         wfPre1p = wfPre /. y1 \rightarrow y1p;
         wfExp1p = wfExp /. y1 \rightarrow y1p;
         wfPre2p = wfPre /. y2 \rightarrow y2p;
         wfExp2p = wfExp /. y2 \rightarrow y2p;
         wfPreC12p = wfPreC /. \{y1 \rightarrow y1p, y2 \rightarrow y2p\};
         wfExpC12p = wfExpC /. \{y1 \rightarrow y1p, y2 \rightarrow y2p\};
         (*we again get to the form f(x) =
           fPre(x) \times e^{fExp(x)} before we calculate the integral using myGauss*)
         thisPre = (wfPre1p /. \{\xi1 \rightarrow s1i \ \xi, \ \xi2 \rightarrow s2i \ \xi\})
                  (wfPreC /. \{\xi 1 \rightarrow s1j \xi, \xi 2 \rightarrow s2j \xi\}) (wfPreC12p /. \{\xi 1 \rightarrow s1k \xi, \xi 2 \rightarrow s2k \xi\})
                  (wfPre2p /. \{\xi 1 \rightarrow s1l \, \xi, \, \xi 2 \rightarrow s2l \, \xi\}) // mySeriesSq // Simplify;
         Print["pre series"];
         thisExp = (wfExp1p /. \{\xi1 \rightarrow s1i \ \xi, \ \xi2 \rightarrow s2i \ \xi\}) +
                (wfExpC /. \{\xi 1 \rightarrow s1j \xi, \xi 2 \rightarrow s2j \xi\}) + (wfExpC12p /. \{\xi 1 \rightarrow s1k \xi, \xi 2 \rightarrow s2k \xi\}) +
                (wfExp2p /. \{\xi1 \rightarrow s1l \xi, \xi2 \rightarrow s2l \xi\}) // Simplify;
         Print["exp simp"];
         summand2 = myGauss[thisPre, thisExp, {y1, y2, y1p, y2p}];
         Print["int"];
         summand2 = summand2 / normsq^2 // mySeriesSq // Simplify; (*normalize*)
         Print["int ser"];
         summand2 = summand2 // Simplify;
         Print["int simp"];
         pre series
         exp simp
         int
         int ser
         int simp
         now sum over the 16 elements:
  ln[s]:= sum = Sum[summand2, {s1i, {-1, 1}}, {s2i, {-1, 1}}, {s1j, {-1, 1}}, {s2j, {-1, 1}},
                {slk, {-1, 1}}, {s2k, {-1, 1}}, {s1l, {-1, 1}}, {s2l, {-1, 1}}] // Simplify;
         finally, the generalized entanglement measure (Eq. 28) is:
 In[0]:= gem = Sqrt[2 (1 - sum)] // Expand // Simplify
Out[0]=
         (1/(3(1+e^{\xi^2})))2te^2\phi\omega
            \sqrt{\left(9+3\ \mathsf{t}^{2}\ \left(1-3\ \xi^{2}\right)\ \omega^{2}+\mathsf{t}^{4}\ \left(1-2\ \xi^{2}\right)^{2}\ \omega^{4}+\mathbb{C}^{2}\ \xi^{2}}\ \left(9+36\ \xi^{4}+3\ \mathsf{t}^{2}\ \omega^{2}+\mathsf{t}^{4}\ \omega^{4}+9\ \xi^{2}\ \left(4+\mathsf{t}^{2}\ \omega^{2}\right)\right)+1}
                 2 e^{\xi^2} (9 + 3 t^2 \omega^2 - 9 t^2 \xi^4 \omega^2 + t^4 \omega^4 - 2 \xi^2 (-9 + t^4 \omega^4)))
         find a nicer representation (Eq. 11) with order 1 functions (Eq. 29):
  ln[\cdot]:= coefflist = (gem/(2te^2\phi\omega))^2 /. \{\xi \to x, \omega \to 1\} // CoefficientList[\#, t] \&;
```

```
In[\cdot]:= f0 = coefflist[1] - 4 x^2 (1 + x^2) // Simplify
Out[0]=
          \left(1 + e^{2 x^2} - 4 x^2 - 4 x^4 + e^{x^2} \left(2 - 4 x^2 - 8 x^4\right)\right) / \left(1 + e^{x^2}\right)^2
  In[*]:= f2 = 3 coefflist[[3]] - 3 x ^ 2 // Simplify
Out[0]=
          \left(1+\,{\rm e}^{2\,\,x^2}\,-\,6\,\,x^2\,+\,{\rm e}^{x^2}\,\,\left(2\,-\,6\,\,x^2\,-\,6\,\,x^4\right)\,\right)\,\left/\,\,\left(1+\,{\rm e}^{x^2}\right)^{\,2}\right.
  In[*]:= f4 = 9 coefflist[[5]] // Simplify
Out[0]=
          (1 + e^{x^2} - 2 x^2)^2 / (1 + e^{x^2})^2
          gem^2 -
                (2 t e^2 \phi \omega \text{Sqrt}[f0 + 4 x^2 (1 + x^2) + f2 (\omega t)^2 / 3 + x^2 (\omega t)^2 + f4 (\omega t)^4 / 9])^
                 2 / \xi \rightarrow x // FullSimplify
            (*a sanity check: this should be zero if Eq. (11) really
                 equals to our result from gem above.*)
Out[0]=
          Plot the functions:
          \mathsf{Plot}\Big[\Big\{ \big(1 + e^{2\,x^2} - 4\,x^2 - 4\,x^4 + e^{x^2}\, \big(2 - 4\,x^2 - 8\,x^4\big) \,\Big) \, \Big/ \, \big(1 + e^{x^2}\big)^2 \, / . \, \, x \to xx \, / \, 2 \, ,
