# The Notebook rel.nb

In this notebook we arrive at the result in Eq. (30) (based on which Eq, (16) was also found), which is the generalized entanglement measure to leading order in 1/c for the case of two gaussians. The calculation proceeds as follows: (1) solving the implicit definition of the retarded time from the paragraph after Eq. (24) to the desired order, (2) defining the relativistic action Eq. (21), (2) finding the classical solutions of the system, (3) computing the gaussian integrals of which Eq. (9) consists, (4) calculating for this wavefunction the generalized entanglement measure [Swain et al, Phys. Rev. A 105, 052441 (2022)] defined in Eq. (28), to get Eq. (30).

```

### **Classical Solutions**

We find the classical trajectories of the particles for initial locations y1p, y2p =  $y'_1/\alpha$ ,  $y'_2/\alpha$  and final locations y1, y2 =  $y_1/\alpha$ ,  $y_2/\alpha$ . Here, the y's are in units of  $\alpha$ . We do it by solving the system under the second order approximation in  $\epsilon$  and in  $\Omega$ . The problem becomes two harmonic oscillators with some frequency trp× $\omega$ , which are coupled by another spring, which is gravity. The variable trp is just a bookkeeping variable which will be taken to zero to achieve the trajectories of the two otherwise free particles coupled by gravity.

```

Sanity check: initial and final locations are actually the y's, the trajectories actually solve the

## Wavefunction

We would now like to compute the wavefunction  $\psi^{-fi}(y1, y2)$  as given in Eq. (9). We start with achieving the expression for the on-shell ( = stationary-phase approximated) action  $S_a^- + S_G^-$ , here Shb.

We now solve the y1p and y2p integrals while also performing the approximations. We denote for any function f the parts fExp and fPre such that  $f(x) = fPre(x) \times e^{fExp(x)}$ . The initial state wfIn is a gaussian.

```
vars = \{y1, y2, y1p, y2p\};
                                                            wfIn = Exp[-(y1p)^2/2-(y2p)^2/2];
                                                           wf4vars = wfIn Exp[i Shb]; (*the integrand in Eq. (9).*)
                                                            wf4vars = wf4vars // mySeries;
                                                            wf4varsExp = Exponent[wf4vars, e];
                                                            wf4varsPre = wf4varsExp[-wf4varsExp];
                                                            wf = myGauss[ wf4varsPre , wf4varsExp, {y1p, y2p}] // Simplify;
                                                               (*This is \psi^{\text{fi}}(y1, y2)*)
                                                            wfExp = Exponent[wf, e] // Simplify
                                                            wfPre = wfExp[-wfExp]

                                                                                                                                                    2 \text{ y1}^2 \in {}^2 \phi \ (20 + 9 \phi - 9 \text{ kin } \Omega^2 + 3 \text{ ret } \Omega^2 - 6 \text{ ret}^2 \Omega^2) +
                                                                                                                                                   2 y2^{2} \in {}^{2} \phi (20 + 9 \phi - 9 kin \Omega^{2} + 3 ret \Omega^{2} - 6 ret^{2} \Omega^{2}) +
                                                                                                                                                   2 \text{ y1} \in \phi \ (-27 + 2 \text{ y2} \in (20 + 9 \phi + 12 \text{ kin } \Omega^2 - 3 \text{ ret } \Omega^2 + 6 \text{ ret}^2 \Omega^2))))
                                                            calculate the norm squared of the state:
             In[@]:= preee = wfPreC wfPre // mySeriesSq // Simplify;
                                                              normsq = myGauss[preee, wfExpC + wfExp, {y1, y2}];
                                                              normsq = normsq // Simplify;
```

we now calculate the entanglement measure in Eq. (28) after replacing the norm square in the formula by multiplication with the conjugate:

```
| [\psi (y1, y2) \psi^* (y'1, y2) dy2 |
         \int_{0}^{2} = \left[ \psi^{*} (y1, y2) \psi (y'1, y2) \psi (y1, y'2) \psi^{*} (y'1, y'2) dy2 dy'2 \right]
  In[*]:= (*each of the four multipicants is slightly
          different in where is the ' and whether it is conjugate*)
         wfPre1p = wfPre /. y1 \rightarrow y1p;
         wfExp1p = wfExp /. y1 \rightarrow y1p;
         wfPre2p = wfPre /. y2 \rightarrow y2p;
         wfExp2p = wfExp /. y2 \rightarrow y2p;
         wfPreC12p = wfPreC /. \{y1 \rightarrow y1p, y2 \rightarrow y2p\};
         wfExpC12p = wfExpC /. \{y1 \rightarrow y1p, y2 \rightarrow y2p\};
         (*again, preform the integral after getting
            to the form myGauss accepts: f(x) = fPre(x) \times e^{fExp(x)} *
         thisPre = wfPre1p * wfPreC * wfPreC12p * wfPre2p // mySeriesSq;
         Print["pre series"];
         thisExp = wfExp1p + wfExpC + wfExpC12p + wfExp2p // mySeriesSq // FullSimplify;
         Print["exp simp"];
         int = myGauss[thisPre, thisExp, {y1, y2, y1p, y2p}];
         Print["int"];
         int = int // Simplify;
         Print["int simp"];
         int = int // mySeriesSq;
         Print["int ser"];
         pre series
         exp simp
         int
         int simp
         int ser
         finally, the generalized entanglement measure from Eq. (28) is calculated to obtain:
  In[a]:= gem = 2 (1-int/normsq^2) // Sqrt // mySeries // FullSimplify;
         gem = gem // Collect[\#, {\Omega, kin}] &
Out[0]=
         \frac{2}{3} t e^2 \phi \omega \sqrt{9 + 3 t^2 \omega^2 + t^4 \omega^4} +
          \left(-\frac{4 \operatorname{kint} \varepsilon^{2} \phi \omega \left(-3+t^{2} \omega^{2}\right)}{\sqrt{9+3 t^{2} \omega^{2}+t^{4} \omega^{4}}}-\frac{\operatorname{ret} \left(-1+2 \operatorname{ret}\right) t \varepsilon^{2} \phi \omega \left(-3+t^{2} \omega^{2}\right)}{\sqrt{9+3 t^{2} \omega^{2}+t^{4} \omega^{4}}}\right) \Omega^{2}
```

the different contributions, see Supplementary Material:

 $ln[\cdot]:=$  gem /. {kin  $\rightarrow$  1, ret  $\rightarrow$  0}

(\*with correction due to gravitation of kinetic energy only\*)

Out[•]=

$$\frac{2}{3} \ t \in^2 \phi \ \omega \ \sqrt{9 + 3 \ t^2 \ \omega^2 + t^4 \ \omega^4} \ - \frac{4 \ t \in^2 \phi \ \omega \ \left(-3 + t^2 \ \omega^2\right) \ \Omega^2}{\sqrt{9 + 3 \ t^2 \ \omega^2 + t^4 \ \omega^4}}$$

 $ln[\cdot]:=$  gem /. {kin  $\rightarrow$  0, ret  $\rightarrow$  1} (\*with correction due to retardation only\*)

Out[0]=

$$\frac{2}{3} \ t \in^2 \phi \ \omega \ \sqrt{9 + 3 \ t^2 \ \omega^2 + t^4 \ \omega^4} \ - \ \frac{t \in^2 \phi \ \omega \ \left( -3 + t^2 \ \omega^2 \right) \ \Omega^2}{\sqrt{9 + 3 \ t^2 \ \omega^2 + t^4 \ \omega^4}}$$

 $In[\cdot]:=$  gem /. {kin  $\rightarrow$  1, ret  $\rightarrow$  1}

(\*with both corrections: the first GR correction to the entanglement\*)

Out[0]=

$$\frac{2}{3} \ \mathsf{t} \in ^2 \phi \ \omega \ \sqrt{9 + 3 \ \mathsf{t}^2 \ \omega^2 + \mathsf{t}^4 \ \omega^4} \ - \ \frac{5 \ \mathsf{t} \in ^2 \phi \ \omega \ \left(-3 + \mathsf{t}^2 \ \omega^2\right) \ \Omega^2}{\sqrt{9 + 3 \ \mathsf{t}^2 \ \omega^2 + \mathsf{t}^4 \ \omega^4}}$$
